

LOCATION

The Location feature helps you communicate your current location with your providers. This feature is designed to help providers connect with you for services or other requests. Providers will *only* have access to the locations that you choose to share with them. Sharing your location may help expedite services or receive care. Using the Location feature, you can update your location at any time through the Location screen, or you may also receive requests for location updates from your provider. When a location request is sent, you will receive a notification asking to add a location update through the Portal. Adding your new location is simple. You can add an address or use your current location if you have location services enabled on your personal device.

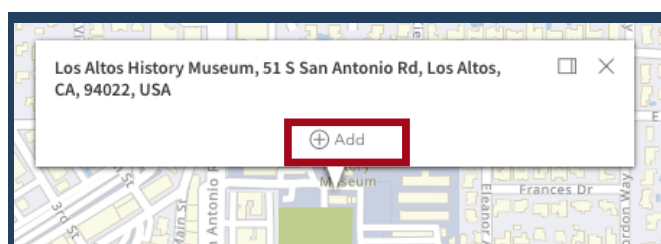

You can click the notification or open the location feature using the navigation pane to add a new location. Add a new address or GPS location by clicking the **Add Location** icon at the top right-hand corner of the location screen.

You can share your current location using the GPS signal associated with your web browser by clicking the **Use Current Location** visible below the search bar. The map will select your current location and an address will be displayed. You can save your location by selecting the **Add** icon. You can also enter an address into the search field and save the location following the same steps as above.

After a location has been added, it will be visible in your location history tab. It's important to note that location data cannot be deleted. If you would like to delete a previous location update, please contact your provider.
